RADIOGRAPHIC FINDINGS

SEX

SF

Abdomen

The surrounding bony structures are within normal limits.

AGE

1 Year, 2 Months

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic tail is not seen.

Both kidneys are seen and present with normal size, shape, delineation and opacity.

The urinary bladder is mildly distended. A small faint mineral opacity is superimposed onto the cranial pole of the urinary bladder and one small intestinal loop in the lateral view.

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Questionable opacity in the urinary bladder.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The lower urinary tract does not appear to be obstructed. The urinary bladder is small. The faint mineral opacity superimposed onto the urinary bladder may well reflect content of the small bowel; however, presence of urinary bladder calculi or sand cannot be ruled out entirely. Consider further definition by means of full urinalysis and abdominal ultrasound.
