RADIOGRAPHIC STUDY OF THE ABDOMEN

SEX

Right lateral and ventrodorsal views totaling 2 images available for review.

NM

RADIOGRAPHIC FINDINGS

AGE

The patient is in thin body condition.

15 Years, 10 Months

The size of the liver is within normal limits. Multiple branching mineralizations tapering towards the periphery are superimposed onto the liver.

INTERPRETED BY

Nele Eley, DVM
 Dr. med. Vet. DipECVDI

The stomach is post-prandial.

The small intestinal loops are evenly distributed throughout the mid abdomen and present a gas pattern. They are turgid in appearance and there the subjective impression of generalized small intestinal wall thickening.

HOSPITAL NAME

DPC Veterinary
 Hospital

A moderate to large amount of inspissated fecal material is seen within the colon.

RADIOGRAPHIC DIAGNOSIS

- Small intestinal maldigestion pattern with subjective impression of small intestinal wall thickening.
- Constipation.
- Biliary tree mineralization - typically benign.

REFERRING VET

Dr. Rivera

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE

48412

The radiographic assessment of intestinal wall thickness is very limited; however, subjectively, there appears to be potential for generalized wall thickening of the small intestine which requires further definition by means of ultrasound.

DATE

11-16-21

The mineralizations of the biliary tree are typically benign and incidental. However, they can be associated with cholangiohepatitis. Correlate with the laboratory values and ultrasound if available.
