

PATIENT

Lennon Oldenburg

PRESENTING CLINICAL SIGNS

vomiting past few days (started 2 days ago, vomiting whenever he eats) - has a tendency to eat things off the ground. Indoor cat. R/O FB vs gastroenteritis vs pancreatitis vs IBD
Abnormal PE/Chem/CBC/UA Results: gingivitis, M3 tartar (208 and 108).

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views of the abdomen totaling 3 images available for review.

BREED

DSH

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Neutered Male

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

6 Years

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic tail is not seen.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation, and opacity. A small amount of mineral opaque material appears to be present within the right renal pelvis.

The urinary bladder is small and within normal limits.

The stomach presents aerophagia. No evidence of gastric foreign material is seen.

HOSPITAL NAME

Truscott Animal
Hospital

The descending colon is thin and non-dilated. The small intestinal loops are evenly distributed throughout the abdomen with no evidence of abnormal dilation, plication, or radiopaque foreign material. However, the small intestinal loops are turgid in appearance with a segmental gas pattern.

A moderate amount of inspissated fecal matter is seen within the colon.

REFERRING VET

Dr. Mena Abdelsayed

RADIOGRAPHIC DIAGNOSIS

- Gastrointestinal maldigestion pattern.

INVOICE

55285

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the abdomen reveals a small intestinal maldigestion pattern. No direct signs of mechanical ileus are seen. Functional ileus is considered likely due to gastroenteritis, pancreatitis, or other. Abdominal ultrasound could be considered for further definition in case of persisting clinical signs.
