

PATIENT PRESENTING CLINICAL SIGNS

Porter Burge 1 week duration of lethargy and hyporexia. Only one episode of vomiting and diarrhea. Blood work performed unremarkable.

SPECIES RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Canine Single lateral view of the thorax and right/left lateral and ventrodorsal views of the abdomen totaling 4 images available for review in jpeg format.

BREED Only jpg images were submitted. The transformation from DICOM to jpg only allows for limited manipulation of the image. For the best possible results, we suggest submitting DICOM images in the future. Please do not hesitate to contact us should you need any help with the submission process.

Mixed

SEX RADIOGRAPHIC FINDINGS

Male Neutered **Thorax**

The surrounding bony structures are within normal limits.

AGE The extrathoracic soft tissues present homogeneous without abnormalities.

4 The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits. The baseline vertebral heart score is 9.4.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

HOSPITAL NAME

Neighborhood Pet Health Center

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

REFERRING VET

Dr. Brandon Burge

The lungs are moderately inflated. The lung parenchyma presents the expected architecture and opacity. The intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

INVOICE Abdomen

55394 The surrounding bony structures are within normal limits.

DATE No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

11-28-22 The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

PATIENT

The liver is appropriate in position, size and presents uniform opacity.

Porter Burge

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

SPECIES

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

Canine

The stomach is in its anticipated position and presents normal content.

BREED

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

Mixed

The colon is seen in the expected position and presents with appropriate content.

SEX

RADIOGRAPHIC DIAGNOSIS

Male Neutered

- Normal radiographic presentation of the thorax and abdomen.

AGE

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

4

The radiographic study of the thorax and abdomen reveals no evidence of bronchopulmonary or cardiovascular pathology. There is no evidence of abdominal organomegaly, mass effects, ileus, or reduced serosal detail. Nevertheless, further definition by means of full abdominal ultrasound can be considered in case of persisting or deteriorating clinical signs, especially should they include gastrointestinal signs specifically.
