BREEDBernese Mountain
Dog**RADIOGRAPHIC STUDY OF THE LEFT FRONT LIMB**

Mediolateral view of the left shoulder and mediolateral and craniocaudal views of the left elbow and left carpus totaling 6 images available for review.

Compared to prior study dated 4-26-22.

SEX

Male

RADIOGRAPHIC FINDINGS

The radiographic signs of panosteitis have fully regressed.

The left elbow and left carpus present within normal limits.

AGE

1 Year

An area of reduced bone opacity and surface irregularity is seen in the caudal contour of the left humeral head. Mild osseous remodeling of the caudal aspect of the glenoid cavity and humeral head appear to be present.

INTERPRETED BYNele Eley, DVM
Dr. med. Vet. DipECVDI**RADIOGRAPHIC DIAGNOSIS**

- Suspect left shoulder osteochondritis.
- Normal radiographic presentation of the left elbow and left carpus.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No further signs of elbow dysplasia are seen. The left carpus presents within normal limits.

HOSPITAL NAMELegacy Animal
Hospital

The panosteitis has resolved radiographically. However, a suspicion of osteochondritis of the left humeral head remains. The size and severity of the defect may be influenced and obscured by the positioning. Presence of bilateral osteochondritis should be considered and ruled out since this is a common presentation. Further definition by means of CT could be considered for verification of the radiographic findings and for a more detailed assessment of the severity of the suspected bone changes.
