

**PATIENT**

Callahan Tullgren

**PRESENTING CLINICAL SIGNS**

One month history of "hard swallowing", excessive drooling, and cough.

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE THORAX**

Single left lateral view of the thorax available for review in jpeg format.

**BREED**

Irish Terrier

Only jpg images were submitted. The transformation from DICOM to jpg only allows for limited manipulation of the image. For the best possible results, we suggest submitting DICOM images in the future. Please do not hesitate to contact us should you need any help with the submission process.

**RADIOGRAPHIC FINDINGS**

**SEX**

MN

The degree of pulmonary inflation is deep. A moderate generalized bronchial lung pattern with peribronchial cuffing and peribronchial interstitial infiltrate is noted and evenly distributed throughout the lung. Multiple incidental pulmonary osteomas are noted.

**AGE**

10 Years

Course and width of the trachea are considered within normal limits. There is no evidence of concurrent mediastinal lymphadenomegaly.

The cardiac silhouette and pulmonary vasculature present within normal limits.

The thoracic boundaries present within normal limits.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

Moderate gastric aerophagia is noted.

**RADIOGRAPHIC DIAGNOSIS**

- Moderate generalized bronchointerstitial lung pattern.

**HOSPITAL NAME**

Hamburg Veterinary  
Clinic

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic findings are compatible with active lower airway disease. Differential diagnosis includes infectious bronchitis such as viral, bacterial, or parasitic as well as eosinophilic/allergic bronchopneumopathy. Airway endoscopy with airway sampling would be ideal for further definition. A clinical trial a treatment for bronchitis could be considered alternatively if not performed already. Involvement of the upper airway should be ruled out.
