

**PATIENT**

Wesley Ojeda

PRESENTING CLINICAL SIGNS

Febrile, and mild cough
Abnormal PE/Chem/CBC/UA Results: Pending

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Single right lateral view available for review.

BREED

Beagle

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Male Neutered

The extrathoracic soft tissues present homogeneous without abnormalities.

The pulmonary vasculature is relatively thin. The caudal vena cava and cardiac silhouette are thin as well.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

AGE

3

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

A moderate bronchial lung pattern with mild peribronchial cuffing is seen and accentuates the caudodorsal lung field.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

The stomach is post-prandial.

HOSPITAL NAME

New Bridge
Veterinary Practice

RADIOGRAPHIC DIAGNOSIS

- Mild to moderate bronchointerstitial lung pattern.
- Hypovolemia with microcardia and underperfusion of the lung.

REFERRING VET

Dr. Abina Glennon

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings are suggestive for active lower airway disease. Consider infectious bronchitis / tracheobronchitis such as viral, bacterial, and less likely parasitic or protozoal a potential versus eosinophilic / allergic bronchopneumopathy. Airway endoscopy with airway sampling would be ideal for further definition. If that is not an option, a clinical trial of treatment for bronchitis could be considered.
