

**PATIENT**

Betty Hildebrand

**PRESENTING CLINICAL SIGNS**

rescued recently from Mexico, sudden onset of lameness on RHL  
Abnormal PE/Chem/CBC/UA Results: RHL lameness , clicking sound on both stifles , RH looked shorter than left , RH positive cranial drawer test during extension only , LH mild clicking sound during exam. BW: mild hyperglycemia .

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE STIFLE**

Mediolateral view of one stifle, without side marker, available for review. Second image provided was not able to be opened.

**BREED**

Terrier Mix

**RADIOGRAPHIC FINDINGS**

Moderate articular swelling is seen as well as a moderate amount of periarticular osteophytes. Cranial thrust of the tibia is presumed; however, the positioning does not allow for accurate determination of the tibial position.

**SEX**

Female Spayed

**RADIOGRAPHIC DIAGNOSIS**

- Moderate osteoarthritis and articular swelling of the stifle with suspect failure of the cranial cruciate ligament.

**AGE**

7 Years

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS****INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

The radiographic findings are suggestive for cranial cruciate ligament injury with moderate osteoarthritis. Correlation with the clinical palpation is required. Concurrent meniscopathy cannot be ruled out. There is no evidence of aggressive bone lesions. Consider resubmitting the orthogonal view or another mediolateral view if available.
