RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views totaling 3 images available for review.

BREED

DSH

RADIOGRAPHIC FINDINGS

The patient is in thin body condition.

SEX

F (sp)

The surrounding bony structures are within normal limits.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

7 Years

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic tail is not seen.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is empty.

HOSPITAL NAME

Cornelius Veterinary
Clinic

The small intestinal loops appear to be empty as well and are evenly distributed throughout the mid abdomen. No evidence of abnormal dilation, plication, or radiopaque foreign material is seen.

The colon contains moderate amounts of gas and fecal matter.

There is no evidence of abdominal organomegaly or a mass effect.

REFERRING VET

Jeff Schutz DVM

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal abdomen.
- Thin body condition.

48962

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No radiographic abnormality of the gastrointestinal tract is identified. The radiographic presentation of the abdomen is within normal limits. The patient is in thin body condition. Owing to the chronicity of the clinical signs and continuous weight loss, further definition by means of full abdominal ultrasound should be considered in order to rule out diffuse gastrointestinal disease, pancreatopathy, and other.
