PRESENTING CLINICAL SIGNS

Owners came home Thursday night and found diarrhea and vomit cont. ate Thursday night and Friday morning but vomited food up. Owner concerned that morning food was still in stomach after vomiting it several hours later. She gave 2 60mg tablets and Scully vomited that up she gave one more 60mg tablet and that stayed down (7pm)

Abnormal PE/Chem/CBC/UA Results: Excessive panting, mild tension in abdomen

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views totaling 5 images available for review.

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is empty except for a mild amount of gas. No abnormal positioning, dilation, or abnormal content is seen.

The small intestinal loops are of even and thin diameter and evenly distributed throughout the mid abdomen without evidence of plication, dilation, or radiopaque foreign material.

The colon is empty except for gas and reveals spasticity accentuating the descending colon.

RADIOGRAPHIC DIAGNOSIS

- Gastrointestinal maldigestion pattern - no evidence of mechanical ileus.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is negative for mechanical small intestinal ileus. A gastrointestinal maldigestion pattern is noted which is an unspecific sign commonly seen with functional ileus. Further definition by means of ultrasound would only be indicated in case of persisting or deteriorating clinical signs.
