

**PATIENT**

Libby Boesplug

PRESENTING CLINICAL SIGNS

Lameness on front right since 11/2021. Not much response to gabapentin and carprofen. No pain response on palpation/manipulation. Radiographs on both front limbs showed no significant findings.

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE ELBOWS

Plain study available for review.

BREED

Brittany Spaniel

COMPUTED TOMOGRAPHIC FINDINGS

Nonuniform opacity and mildly irregular outline of the right medial coronoid process are seen. The trochlear notch of the ulnar presents mild sclerosis. There is a smooth new bone formation on the anconeal process.

SEX

Female Spayed

An incomplete lucent line appears to be present in the tip of the left medial coronoid process. Mild subtrochlear notch sclerosis and mild smooth new bone formation on the anconeal process are noted.

AGE

4 Years, 5 Months

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Suspect bilateral medial coronoid pathology without obvious fragmentation.
- Minimal degenerative joint disease of both elbows.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The available images do suggest presence of medial coronoid pathology with either osteomalacia or fissuring. However, the noted changes are mild and at the border of the spatial resolution of the study. Secondary degenerative changes are subtle as well and the clinical significance of which remains questionable, especially since the history reports lacking response to systemic NSAID treatment which would be atypical with the pertinent CT findings.
