

PATIENT PRESENTING CLINICAL SIGNS

Champ Wardynski Has been limping on the back Left leg for about a month now but it seemed to get worse on Monday the 13th.

SPECIES Abnormal PE/Chem/CBC/UA Results: PE: RED EARS, INFLAMMED BUT BP IS VERY HIGH LEFT HIND LAME AND STRAIGHT GATED. RIGHT AND LEFT STIFLES WITH MEDIAL BUTTRESS AND EFFUSION But looks good other wise. Uranalysis: SG: 1.025 pH: 6.0 Sediment was quite Labs are pending

Canine

RADIOGRAPHIC STUDY OF THE STIFLES & PELVIS

BREED Mediolateral and craniocaudal views of the stifles and ventrodorsal view of the pelvis totaling 5 images available for review.

Pit Bull

RADIOGRAPHIC FINDINGS

SEX Severe articular swelling of the left stifle joint is seen. There is mild displacement of the popliteal sesamoid bone and minimal cranial thrust of the tibia. A mild amount of periarticular osteophytes is present.

Neutered Male

AGE Moderate articular swelling of the right stifle joint is seen. There appears to be minimal cranial thrust of the tibia. The position of the popliteal sesamoid bone is considered within normal limits. A mild amount of periarticular osteophytes is present.

3 Years

The muscle volume appears to be relatively symmetric between the left and right hind limb on the orthogonal view.

INTERPRETED BY

Nele Eley (Ondreka),
 DVM Dr. med. vet.,
 DipECVDI

No major abnormalities of the pelvis are seen.

RADIOGRAPHIC DIAGNOSIS

- Moderate articular swelling and mild osteoarthritis with radiographic evidence of cranial cruciate ligament failure in both stifles

HOSPITAL NAME

Elizabeth AH

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS
REFERRING VET

Dr. Leon Anderson

The radiographic study suggests potential for presence of cranial cruciate ligament failure in both stifles. There is evidence of mild degenerative joint disease along with moderate articular swelling in both stifle joints. Potential failure of the cranial cruciate ligament is indicated as per the presence of mild cranial thrust of the tibia. Aspiration and analysis of synovia could be considered in order to rule out other arthropathy including immune mediated, should this be a potential based on the patient's history.
