PRESENTING CLINICAL SIGNS

Discharge in R eye.

COMPUTED TOMOGRAPHIC STUDY OF THE HEAD

Plain and post contrast studies are available for review.

COMPUTED TOMOGRAPHIC FINDINGS

The ocular and retrobulbar structures present within normal limits.

Both globes are normal in size, shape, and attenuation.

The retrobulbar tissues are unremarkable with discernible retrobulbar fat tissue. No evidence of mass, inflammation, or foreign material is noted.

The extraocular muscles and optic nerves appear normal.

Bony orbits are intact and symmetric with no evidence of fractures, lysis, or sclerotic lesions.

The orbital canal and nasolacrimal ducts appear normal and patent.

Midline nasal septal deviation is noted; mild and likely incidental. Nasal turbinates are normal. There is no evidence of mass, fluids, soft tissue attenuation, or foreign material noted.

The regional lymph nodes are within normal limits.

Dental changes are within age related normal limits.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Normal ocular, retrobulbar, and orbital structures.
- Patent nasolacrimal ducts bilaterally.
- Mild nasal septal deviation; otherwise, normal nasal cavities.

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS

No structural cause is identified for the right eye discharge on CT. The CT study does not reveal any structural abnormality that would explain the right eye discharge. Etiologies may include surface disease such as conjunctivitis, keratitis, corneal irritation, or other tear film abnormalities, early or subtle nasolacrimal duct obstruction not detectable on CT, inflammatory/infectious conditions, and other. Further ophthalmologic workup could be considered if not performed already.
