

PATIENT

Harley Fowler

PRESENTING CLINICAL SIGNS

Harley is my personal pet. She is an athlete and does dock diving and FastCat. She exhibits pain on extension and rotation of hindlimbs and palpation in area of iliopsoas. She is starting to drop her hocks a small amount. X-ray revealed possible superficial digital tendinopathy.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

Right Achilles Tendon

The outline of the tuber calcis is smooth and without defects or evidence of new bone formation. The attachments of the deep calcaneal tendon and gastrocnemius tendon to the calcaneal surface present within normal limits. Both portions of the deep achilles tendon present smoothly delineated, intact peritendineum, and regular internal echoarchitecture and echogenicity with no evidence of core or superficial lesions. The superficial digital flexor tendon is of even thickness with uniform fiber pattern and echogenicity and smooth delineated peritendineum. No evidence of calcaneal bursitis is seen.

BREED

German Shepherd

ULTRASONOGRAPHIC DIAGNOSIS

- Normal ultrasonographic presentation of both achilles tendons.

HOSPITAL NAME

County Line
Veterinary Clinic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The ultrasonographic study does not reveal evidence of structural tendon injury in the right and left achilles tendons. The ultrasonographic presentation of all components of the achilles tendon is considered within normal limits in the right and left hind limb. No regional inflammation is noted.
