

PATIENT

Koby Espino

PRESENTING CLINICAL SIGNS

Lameness Right pelvic limb. Bilateral Grade 1 MPL, otherwise normal.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE STIFLES & PELVIS

Mediolateral view of both stifles and ventrodorsal view of the pelvis totaling 3 images available for review.

BREED

French Bulldog

RADIOGRAPHIC FINDINGS

Pelvis

The coxofemoral joints present within normal limits. No evidence of dysplasia or osteoarthritis is seen.

SEX

Male

The pelvic bones present bilaterally symmetric and within normal limits.

There is no evidence of significant muscle atrophy.

AGE

2 Years

Stifles

The patellae are in situ at the time of the exposure.

Mild articular swelling of both stifle joints is seen as well as mild periarticular osteophytes accentuating the proximal part of the femoral trochlea. The changes are bilaterally symmetric.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

There is no evidence of cranial thrust of the tibiae.

RADIOGRAPHIC DIAGNOSIS

- Mild bilateral stifle osteoarthritis.

HOSPITAL NAME

Byram Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals bilaterally symmetric mild osteoarthritic changes with mild articular swelling of the stifle joints. The patellae are in situ at the time of the exposure which is what is expected in grade 1 luxation. The patella luxation may be the cause of the radiographic changes. Concurrent diseases such as cruciate ligament pathology, meniscopathy, other arthropathy including arthritis cannot be ruled out entirely. Correlation with the clinical palpation recommended. Aspiration and analysis of synovia could also be considered for further definition in case of doubt.
