

PATIENT

Shadow Caserta

PRESENTING CLINICAL SIGNS

Vomited food/liquid 2x yesterday and 3x today, no bile. E/D well, except throws up everything she ate according to O. Urinating and passing stool normally. R/o foreign body

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views totaling 4 images available for review.

BREED

Bernese Mountain Dog Mix

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

SEX

Spayed Female

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

7 Months

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

A mild amount of gas is seen within the stomach. There is no evidence of foreign material, abnormal dilation, or malpositioning of the stomach.

The small intestinal loops are evenly distributed throughout the mid abdomen. The descending duodenum is mildly dilated with gas without evidence of foreign material. No evidence of significant dilation, radiopaque foreign material, or plication of the small intestine is seen.

HOSPITAL NAME

Truscott Animal Hospital

The colon contains a moderate amount of relatively inspissated fecal material.

RADIOGRAPHIC DIAGNOSIS

REFERRING VET

Medhat Meawad

- No radiographic evidence of mechanical ileus or radiopaque foreign material throughout the gastrointestinal tract.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE

48791

The radiographic study reveals no radiopaque foreign material within the gastrointestinal tract. A maldigestion pattern with mild gas dilation of the descending duodenum is seen. However, this is not representing an overt obstructive pattern. Further clinical monitoring could be considered under supportive care; however, should the patient's clinical signs persist or deteriorate, further definition by means of ultrasound should be considered.
