

**PATIENT**

Shurik Kushnir

**PRESENTING CLINICAL SIGNS**

O noticed pet limping and not putting weight on front right leg Walk- lame 4/5 lame on RF

**SPECIES**

Feline

**RADIOGRAPHIC STUDY OF THE RIGHT ELBOW & BOTH FRONT PAWS**

Mediolateral and craniocaudal views of the right elbow and craniocaudal views of both elbows and front paws totaling 4 images available for review.

**BREED**

Domestic Short Hair

**RADIOGRAPHIC FINDINGS**

No structural abnormality of the front paws is noted.

There appears to be reduced muscle volume in the right front limb.

**SEX**

MN

Moderate osteoarthritic changes of the right elbow with periarticular osteophytes, subtrochlear notch sclerosis of the ulnar, and ill-defined medial coronoid process are seen. There appears to be new bone formation medial and distal of the medial humeral epicondyle.

**RADIOGRAPHIC DIAGNOSIS**

- Moderate osteoarthritis and suspect medial epicondylitis of the right elbow.
- Muscle atrophy of the right front limb.

**AGE**

12

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Mild to moderate osteoarthritis of the right elbow is noted. There also is radiographic evidence of chronic medial epicondylitis with new bone formation. Presence of medial coronoid pathology cannot be ruled out. It remains questionable as to whether the relatively fair degree of radiographic changes justifies 4 out of 5 clinical lameness and the degree of muscle atrophy present in this patient. Other pathology including neurologic should be considered as well if the patient's clinical signs cannot be ascertained to originate from the elbow based on the clinical palpation.
