

**PATIENT**

Marley Harris

PRESENTING CLINICAL SIGNS

Lethargic and suppressed appetite/not drinking as much. Bloodwork showed elevated WBCs and neutrophils. ALT, ALP and Bilirubin was elevated. ALT was 3457 (normal range: 18-121)

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views totaling 3 images available for review.

BREED

Yorkshire Terrier

RADIOGRAPHIC FINDINGS

Patient has a history of right sided femoral head ostectomy.

Lag screw in the left iliosacral joint seen.

SEX

Male

The left coxofemoral joint presents dysplasia with moderate osteoarthritis.

Stifle osteoarthritis is seen.

The abdominal cavity is voluminous.

AGE

9 Years

Reduced serosal detail is seen in the mid and ventral abdomen.

Severe right sided enlargement of the liver with mass effect is noted deviating the gastric body and pylorus to the left side of the abdomen as well as dorsally.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Abdominal organomegaly with suspect liver origin and mass effect as well as peritoneal effusion.

HOSPITAL NAME

Truscott Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings are highly suggestive for mass like enlargement of the liver. Differential diagnosis includes neoplasia as well as cyst, hematoma, granuloma, and abscess. The findings furthermore suggest presence of peritoneal effusion which may represent transudate, modified transudate, and exudate including paraneoplastic effusion, peritonitis, carcinomatosis, and hemascos. Further definition by means of ultrasound is strongly recommended if not performed already. Sampling and analysis of the fluid could be considered as well.
