RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Right /left lateral and ventrodorsal views of the thorax and abdomen totaling 6 images are available for review.

AGE

1yr

RADIOGRAPHIC FINDINGS

THORAX

INTERPRETED BY

The presentation of the thorax is normal on the available radiographs.

Nele Eley (Ondreka),
DVM Dr. med. vet.,
DipECVDI

There is no evidence of pneumothorax, pulmonary contusion, rib or thoracic vertebral fractures.

Size and morphology of the cardiac silhouette are considered within normal limits. Vertebral heart score is 10.

HOSPITAL NAME

Trachea and mediastinum present within normal limits.

Elizabeth Animal
Hospital

A small amount of subcutaneous soft tissue swelling is seen dorsal to the scapulae (injection site).

ABDOMEN

REFERRING VET

The stomach is postprandial.

Jennifer Redus, DVM

Retroperitoneal and serosal detail are good. The deep circumflex arteries are visible which is a sign of good retroperitoneal detail. There is no evidence of free fluid, organ rupture or traumatic injury.

INVOICE

The urinary bladder is mildly distended at the time of the examination.

23864

The lumbar spine appears intact with no vertebral fractures or luxation identified.

No evidence of significant subcutaneous emphysema is seen.

RADIOGRAPHIC DIAGNOSIS

PATIENT

Sadie Mae Brown

- No radiographic evidence of thoracic or abdominal organ trauma
- No fractures or dislocations detected

SPECIES

Canine

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS

The soft tissue injury appears to be superficial. Evidence of spinal or rib cage fracture or internal thoracic or abdominal injury is not seen radiographically at this time. Continued monitoring for signs of pain, swelling or internal bleeding. Supportive care for abrasions, superficial and/ or orthopedic injuries is recommended.
