

PATIENT

Osita Ehrman

PRESENTING CLINICAL SIGNS

Acute episodes of shaking, mild discomfort cranial abdomen and on lateral cervical flexion, no improvement on oral NSAID
Abnormal PE/Chem/CBC/UA Results: cbc/chem/ua/t4 pending

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN, CERVICAL, THORACIC, & LUMBAR SPINE

Lateral and ventrodorsal views of the abdomen, lateral views of the cervical and thoracic spine, and ventrodorsal view of the cervical spine totaling 6 images available for review.

BREED

Terrier Mix

RADIOGRAPHIC FINDINGS

Abdomen

The patient is mildly obese.

SEX

FS

No evidence of abdominal organomegaly or mass effect is seen.

The abdominal serosal detail appears to be maintained.

AGE

9 Years

The ventral abdominal wall is mildly pendulous.

Both coxofemoral and stifle joints present within normal limits.

Number, alignment, and anatomy of the lumbar vertebrae present within normal limits.

The lumbosacral and thoracolumbar junctions present within normal limits.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Cervical & Thoracic spine

The craniocervical junction presents within normal limits.

The C2/3 intervertebral disc space appears to be reduced in width.

Number, alignment, and anatomy of the thoracic vertebrae present within normal limits.

No evidence of aggressive bone lesions is seen.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

DATE

2-2-22

The radiographic study reveals evidence of intervertebral disc disease within the upper cervical spine between C2 and C3. The changes may reflect uncomplicated degenerative disc disease however disc hernia and compressive myelopathy cannot be ruled out. Depending on the severity and development of the patient's clinical signs, further definition by means of cross sectional imaging would be an option in this patient.
