

PATIENT PRESENTING CLINICAL SIGNS

Molly Cabral coughing for 2 month
Abnormal PE/Chem/CBC/UA Results: N/A

SPECIES RADIOGRAPHIC STUDY OF THE THORAX & NECK

Canine Right/left lateral and ventrodorsal whole body views totaling 3 images available for review.
Thoracic and neck read requested.

BREED RADIOGRAPHIC FINDINGS

Poodle Toy **Thorax**

SEX The surrounding bony structures are within normal limits.

Female Spayed A small soft tissue opaque nodule in the dorsum level with the mid lumbar spine is seen.

AGE The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits. The vertebral heart score is 10.2.

12 Years The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

INTERPRETED BY A mild generalized bronchial lung pattern with mild peribronchial cuffing is seen.

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

HOSPITAL NAME There is mild generalized enlargement of the liver with pointed liver margins.

St. Catherine's Animal
Hospital

Neck
Moderate dorsoventral flattening of the cervical trachea is seen on both lateral views.

REFERRING VET RADIOGRAPHIC DIAGNOSIS

- Dr. Boctor
- Cervical tracheal collapse.
 - Radiographically normal cardiac silhouette.
 - Mild bronchial lung pattern.
 - Mild hepatomegaly.

INVOICE INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

50511 The radiographic findings are suggestive for dynamic tracheal disease. A concurrent mild and generalized bronchial lung pattern is noted and suggests presence of chronic lower airway disease such as eosinophilic / allergic bronchopneumopathy versus infectious bronchitis such as viral, bacterial, and less likely parasitic, or protozoal. The clinical significance of the bronchopulmonary changes is questionable. Further definition by means of airway endoscopy

with airway sampling is recommended.

Differential diagnosis for the hepatomegaly includes metabolic / endocrine hepatopathy. Diffuse inflammatory / infectious or neoplastic infiltrates cannot be ruled out. Correlate with the laboratory values and consider ultrasound as well as parenchymal sampling if indicated.
