PRESENTING CLINICAL SIGNS

Limping on RH since November. Did not improve with Rimadyl and Gabapentin. Did have some swelling around R knee in november that has since resolved, no cranial drawer ever elicited. Abnormal PE/Chem/CBC/UA Results: Walking fine in room today, but HX of RH lameness. No cranial drawer or pain on manipulation of joints today. Obtained radiographs under dexdormitor - have been concerned about possible hip dysplasia due to history and lack of cranial drawer.

RADIOGRAPHIC STUDY OF THE PELVIS & STIFLES

Ventrodorsal and lateral views of the pelvis and mediolateral views of the stifles totaling 5 images available for review.

RADIOGRAPHIC FINDINGS

The muscle volume of both hind limbs appears adequate and relatively symmetric.

Both femoral heads are round and well situated within the acetabulum. The joint spaces are narrow and even. The femoral head coverage appears adequate. No evidence of osteoarthritic changes is seen.

The stifles present within normal limits. There is no evidence of articular swelling, cranial thrust of the tibia, osteoarthritic changes, or subchondral bone defects in either of the stifle joints.

Dirt fur artifact noted.

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal pelvis and stifle joints.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic presentation of both coxofemoral joints and both stifle joints is within the expected limits. No signs of hip dysplasia, osteoarthritis, or stifle arthropathy are seen.

PATIENT

Pippa Saint Amour

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
