

PATIENT PRESENTING CLINICAL SIGNS

Zoe Pigott-Upshall
SPECIES Canine
 woke up this morning, very lethargic, and slow to move. Was favoring the RF leg, but now it's better. CBC shows a mod to marked leukocytosis, from neutrophilia and left shift and monocytosis. Chemistry is all WNL. Cause of infection not apparent. No external wounds or tissue necrosis. No vomiting or diarrhea. Appetite is slightly decreased today. SNAP cPL normal
 Abnormal PE/Chem/CBC/UA Results: Mod to marked neutrophilia with left shift, and monocytosis.

BREED Shep X
RADIOGRAPHIC FINDINGS
Abdomen

SEX FS
 No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

AGE 10 Months
 The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY Nele Eley, DVM
 Dr. med. Vet. DipECVDI
 Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is post-prandial.

HOSPITAL NAME Balmy Beach Pet Hospital
 The small intestinal loops are turgid in appearance with predominance of a gas pattern. No evidence of abnormal dilation, plication, or radiopaque foreign material is seen.

The colon and cecum present within normal limits.

REFERRING VET **Right Elbow**

Dr. Singh
 The right elbow presents within normal limits. No evidence of abnormal articular swelling, medial coronoid pathology, or other signs of elbow dysplasia are seen.

INVOICE 50579
 The radiographic presentation of the right shoulder is oblique with overlapping glenoid cavity and humeral head; however, as far as assessable, no radiographic signs of right shoulder arthropathy are identified.

RADIOGRAPHIC DIAGNOSIS

- DATE** 2-27-22
- Radiographically normal abdomen.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic presentation of the abdomen was within normal limits. There was no evidence of peritoneal effusion or other sources of reduced peritoneal detail. No evidence of abdominal mass effect or organomegaly was noted. Consider full internal medicine workup.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
