

PATIENT PRESENTING CLINICAL SIGNS

Miller Brand
intermittent right front lameness. worse after exercise and first thing in the morning.
Abnormal PE/Chem/CBC/UA Results: none

SPECIES RADIOGRAPHIC STUDY OF THE FRONT LIMBS

Canine
Mediolateral views of both shoulders and mediolateral and craniocaudal views of both elbows and carpi totaling 9 images available for review.

BREED RADIOGRAPHIC FINDINGS

Boston Terrier
Shoulders

The findings of the shoulders are considered within age related normal limits. There is no evidence of subchondral bone defects, traumatic osseous injury, growth plate lesions, or osteoarthritis.

SEX

Male

Elbows

The medial coronoid processes present within normal limits.

AGE

6 Months

The elbow joint surfaces appear to be congruent in both front limbs.

There is no evidence of subchondral bone defects.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The positioning of the craniocaudal view of the right elbow does not allow for assessment of the completeness of the intercondylar fusion. However, no structural abnormality is seen directly.

The lateral and medial humeral condyle of the left elbow are completely fused.

HOSPITAL NAME

East Bend Animal
Hospital

Carpi

The carpal bones are in situ. There is no evidence of fracture, disturbed ossification, subluxation, or luxation. No abnormal soft tissue swelling is noted.

REFERRING VET

Jaime Thurk

RADIOGRAPHIC DIAGNOSIS

- Normal radiographic presentation of the front limbs.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE

56600

The radiographic findings of the bilateral shoulders, elbows, and carpi are considered within age related normal limits. No evidence of distributed ossification, traumatic osseous injury, and no abnormal soft tissue swelling is seen. Soft tissue pathology such as trauma or inflammation, however, cannot be ruled out entirely and remains a potential.
