

**PATIENT**

Rosalita Feld

**PRESENTING CLINICAL SIGNS**

acute Vomiting, copious saliva

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE ABDOMEN**

Right and left lateral views totaling 2 images available for review.

**BREED**

Labradoodle

**RADIOGRAPHIC FINDINGS**

The abdominal serosal detail appears to be reduced in the mid abdomen and caudal of the stomach as well.

The urinary bladder is small.

**SEX**

Female / sp

Mild generalized enlargement of the liver is noted.

A minimal amount of mineral opaque material appears to be present within the intestines and is seen in the cranial abdomen.

**AGE**

10 Years

Turgid appearance of the small intestinal loops with discrepant gas pattern is seen. There is no evidence of abnormal dilation, plication, or radiopaque foreign material.

The descending colon appears to be mostly empty. Presence of fluid content cannot be ruled out.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

**RADIOGRAPHIC DIAGNOSIS**

- Reduced peritoneal detail.
- Gastrointestinal maldigestion pattern.
- Hepatomegaly.

**HOSPITAL NAME**

New Bridge  
Veterinary Practice

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic findings support the presence of peritonitis or peritoneal effusion. The reduced serosal detail appears to accentuate the intestinal mesentery. No radiographic signs of mechanical ileus are seen yet a maldigestion pattern is identified and abdominal ultrasound is strongly recommended for further definition to screen for potential causes of peritonitis and/or peritoneal effusion.

**REFERRING VET**

Dr. Abina Glennon

The degree of hepatic enlargement appears to be mild and metabolic and endocrine hepatopathy as well as hepatitis are potential differential diagnoses. Correlate with the laboratory values and ultrasonographic findings as available.
