

**PATIENT**

Paddy Watts

**PRESENTING CLINICAL SIGNS**

Fever 105.6 Cough/gagging/vomiting decreased app

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE NECK, THORAX, & ABDOMEN**

Lateral views of the neck, lateral and ventrodorsal views of the thorax, and lateral and ventrodorsal views of the abdomen totaling 7 images available for review.

**BREED**

Heeler

The patient is obese.

**SEX**

Female

**Neck**

No overt evidence of an abnormal mass effect or abnormal opacity is seen in the neck.

There is mild upper esophageal aerophagia.

Course and width of the cervical trachea are considered within normal limits.

**AGE**

6 Years

**Thorax**

Multiple mild to moderate spondyloses are seen throughout the mid and caudal thoracic spine.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

The degree of pulmonary inflation is fair. No evidence of pulmonary masses or nodules is seen.

There is no evidence of abnormal mediastinal widening.

The radiographic presentation of the cardiovascular structures is within normal limits.

**HOSPITAL NAME**

Pacific Avenue  
Veterinary Clinic

The thoracic trachea presents within normal limits.

**Abdomen**

Moderate spondyloses are present within the mid and caudal lumbar spine.

**REFERRING VET**

Dr. Sid Bruckert-Frisk

The abdominal serosal detail is maintained.

The kidneys and urinary bladder present within normal limits.

The splenic tail is mildly prominent.

**INVOICE**

50200

The liver presents within normal limits.

The stomach contains a moderate amount of gas.

**DATE**

2-9-22

The small intestinal loops are turgid in appearance. No evidence of abnormal dilation, plication, or radiopaque foreign material of the small intestine is seen.

There is a mild amount of fecal material within the descending colon.

**PATIENT**

Paddy Watts

**RADIOGRAPHIC DIAGNOSIS**

- Radiographically normal thorax.
- Gastrointestinal maldigestion pattern - no evidence of mechanical ileus.
- No evidence of mass effect in the neck.

**SPECIES**

Canine

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study reveals no structural abnormality in the neck region yet upper airway pathology including laryngitis, tracheitis, laryngeal malfunction, and other cannot be ruled out.

**BREED**

Heeler

The radiographic presentation of the thorax was within normal limits.

**SEX**

Female

The abdominal study reveals a gastrointestinal maldigestion pattern. There is no radiographic evidence of mechanical small intestinal obstruction. Functional ileus appears likely. Further definition by means of abdominal ultrasound could be considered in case of persisting or deteriorating clinical signs.

**AGE**

6 Years

**INTERPRETED BY**
