PRESENTING CLINICAL SIGNS

Vomited up food once last week, then 2 days ago he vomited 3 times and once yesterday, no V+ episode today. Episodes have abdominal component. Every time he vomited owner says it smells like poop she is not sure if he is eating poop or not. 1- 4 hours after eating food. Looks like undigested food. Is drinking water and owner is giving him pedialyte. Owner has been giving him boiled rice with his food and turmeric. A smiley face sponge was found shredded few weeks ago. Remains otherwise normal behaviors
Abnormal PE/Chem/CBC/UA Results: Bit of a caution; not able to perform full PE.

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right lateral and ventrodorsal views totaling 3 images available for review.

RADIOGRAPHIC FINDINGS

The abdominal serosal detail is maintained.

The stomach contains a moderate amount of granulated soft tissue opaque material mixed with gas and a small amount of mineral opaque foci.

The small intestinal loops are evenly distributed throughout the mid abdomen. No evidence of abnormal dilation, plication, or radiopaque foreign material is seen.

The colon contains a moderate amount of fecal material.

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal abdomen.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no evidence of mechanical ileus. The radiographic presentation of the gastrointestinal tract is considered within normal limits. The small amount of gravel within the stomach is likely due to intake of mineral material. No radiographic evidence of other foreign material was found.

PATIENT

Sinder Sgroi

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

SPECIES

Dog

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
