

PATIENT

Banjo Sullivan

PRESENTING CLINICAL SIGNS

Patient presents for chronic lower lameness to left hind leg/stifle; sore stifle joint; no cranial drawer. Current meds: Tramadol and trazodone.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

Left Stifle

No abnormal effusion is seen within the supra- and infra patellar area. There is no evidence of synovial or capsular thickening or proliferation. The cranial cruciate ligament appears to be continuous and well-delineated, no deviation from normal echoarchitecture is noted. Lateral and medial menisci are within their anticipated positions and align well below the bone surfaces, meniscal surfaces are even and smooth. The echotexture is hypo echoic and uniform. The joint margins are smooth, no osteophytes are seen. The infra patellar fat pad present, the expected echo architecture.

ULTRASONOGRAPHIC DIAGNOSIS

- Normal ultrasonographic presentation of both stifle joints.

HOSPITAL NAME

Sova Animal Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The ultrasonographic study does not reveal evidence of effusion, synovialitis, cruciate ligament, or meniscal injury in the stifle joints. Extraarticular pathology such as gastrocnemius muscle injury or other cannot be ruled out entirely. However, the ultrasonographic findings do not support presence of stifle arthropathy at this point.
