

**PATIENT PRESENTING CLINICAL SIGNS**

Molly Rodriguez P is here for an examination, adopted in January this year from PetSmart, O was told P has a heart murmur but was not told how bad, P was spayed and O was told the P only has 1 tooth, P is biting feet, O is unsure if it's from the litter O would like a nail trim for the P P also has watery eyes

**SPECIES** Rabies 1 yr was given on 12/7/2021 FVRCP 1yr was given on 12/7/2021 FIV/FELV -negative P was dewormed Ear cytology was done O: BAR, m.m-pink, CRT < 2sec, missing all teeth expect 204, EENT, H- 4/6 murmur, L, Abdo, U/G, skin and coat A: Heart murmur

Feline Abnormal PE/Chem/CBC/UA Results: Diag- Phos 3.0

**BREED RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN**

Domestic Short Hair Right/left lateral and ventrodorsal views of the thorax and lateral and ventrodorsal views of the abdomen totaling 4 images available for review.

**SEX RADIOGRAPHIC FINDINGS**

Female **Thorax**

Early spondylosis deformans is seen in the caudal thoracic spine.

**AGE** The extrathoracic soft tissues present homogeneous without abnormalities.

8 Years The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits. The vertebral heart score is 8 which is within the reference range.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

**HOSPITAL NAME**

Animal Paradise Hospital The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

**REFERRING VET**

Dr. Elshafie The lung parenchyma presents the expected architecture and opacity. The intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

**INVOICE Abdomen**

51064 The patient is in thin body condition.

The abdominal serosal detail is reduced.

**DATE**

3-19-22 Crowding of intestinal loops is seen in the mid abdomen. Not all small intestinal loops are clearly delineated. There is a segmental gas pattern. Part of the small intestine appears to contain smaller amounts of mineral opaque material.

**PATIENT**

Molly Rodriguez

The stomach is postprandial.

A mild amount of inspissated fecal matter is seen in the colon.

**SPECIES**

Feline

**RADIOGRAPHIC DIAGNOSIS**

- Reduced serosal detail in the abdomen.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic presentation of the thorax was within normal limits including the cardiac silhouette. A cardiac echo would be required to rule out valvular insufficiencies and dynamic motion abnormality as well as cardiomyopathies.

The reduced abdominal serosal detail may be due to lack of peritoneal fat and crowding of the intestine within the mid abdomen. However, small amounts of peritoneal effusion and/or peritonitis cannot be ruled out entirely and abdominal ultrasound could be considered for further definition to rule out presence of effusion, mesenteropathy, or other abdominal abnormality.
