PRESENTING CLINICAL SIGNS

One week history of intermittent pain and lameness on LF during gentle agility work. Immediately yelps out in pain, won't let owner touch limb and within 5-10 minutes will return to normal gait.

Abnormal PE/Chem/CBC/UA Results: Normal gait at time of exam. No pain elicited on palpation or ROM.

RADIOGRAPHIC STUDY OF THE LEFT ELBOW

Mediolateral and craniocaudal views of the left elbow totaling 4 images available for review in jpeg format.

RADIOGRAPHIC FINDINGS

The medial coronoid process of the left elbow is well opacified and smoothly delineated. No evidence of elbow incongruity is seen. There is no evidence of subchondral bone defects or periarticular osteophytes. No significant articular swelling is noted.

The humerus, radius, and ulna present within the expected limits.

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal left elbow.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the left elbow is within normal limits. No evidence of left elbow arthropathy is identified. Consider lameness of other origin such as musculotendinopathies including shoulder instability, rotator cuff injury, and other a potential.

PATIENT

Katie Kjos

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
