PRESENTING CLINICAL SIGNS

Chronic RH limb lameness

COMPUTED TOMOGRAPHIC STUDY OF THE HIND LIMBS**SPECIES**

Canine

Plain and post contrast studies of the hind limbs from the coxofemoral joints to the paws available for review.

BREED

Lab mix

Anatomy and alignment of the pelvic bones are within normal limits.

Minimal joint space divergence of the coxofemoral joints is seen with mild circumferential femoral head osteophytes. However, no overt subluxation or no significant osteoarthritis is noted.

SEX

Spayed Female

The muscle volume of both hind limbs appears adequate and symmetric.

The right stifle joint is not entirely included in the collimated field of view. Visible parts of the right stifle joint present within normal limits.

AGE

1 Year, 9 Months

The tarsal joints present within normal limits. There is no evidence of subchondral bone defects, traumatic osseous injury, or osteoarthritis.

The metatarsophalangeal joints are considered within normal limits as well.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Normal CT findings of the hind limbs.

HOSPITAL NAME

Aloha Pet & Bird
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The source of the clinical lameness remains unclear based on the available CT images. There is no evidence of traumatic osseous injury or osteoarthritis throughout the hind limbs. No evidence of congenital or developmental arthropathy is seen. The right stifle joint is not fully included in the collimated field of view; however, assessment of the intraarticular structures such as the cruciate ligaments and menisci is limited with CT anyway. Consider soft tissue trauma or inflammation as well as neurologic disease as potential sources of the clinical lameness.
