

PATIENT

Buddy Evenson

PRESENTING CLINICAL SIGNS

vomiting multiple times today since this morning. food and pink fluid in the vomitus. patient has been on prednisone for a few months due to IVDD. he is also on gabapentin, diazepam and methocarbamol.

Abnormal PE/Chem/CBC/UA Results: elevated liver enzymes, hepatomegaly, mass like effect in gall bladder on ultrasound, shadow is cast by hyperechoic mass in fluid of gall bladder.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views of the abdomen totaling 3 images available for review.

BREED

Terrier Mix

RADIOGRAPHIC FINDINGS

The patient's body condition score appears to be mildly excessive.

A fat opaque subcutaneous mass is seen in the right caudolateral and ventral abdominal wall.

SEX

Male Neutered

Moderate generalized enlargement of the liver with rounded lobar margins is noted.

Moderate gastric aerophagia is seen.

AGE

13 Years

The small intestinal loops are evenly distributed throughout the mid abdomen with no evidence of abnormal dilation, plication, or radiopaque foreign material.

Wire shaped metal opaque foreign material is seen in the ileocecolic region.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

No evidence of reduced serosal detail is noted.

The urinary bladder presents within normal limits.

HOSPITAL NAME

Northshore
Veterinary Hospital

RADIOGRAPHIC DIAGNOSIS

- Gastrointestinal aerophagia
- Large intestinal foreign material- nonobstructive and nonperforating
- Moderate generalized hepatomegaly.
- Abdominal lipoma in the right caudoventral abdominal wall.
- Excessive body condition score.

REFERRING VET

Kimberly Barron

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings of the liver are compatible with steroid induced hepatopathy. Other diffuse parenchymal disease such as vacuolar hepatopathy, metabolic liver disease, hepatitis, and diffuse infiltrative disease cannot be ruled out entirely but is thought less likely based on the patient history.

INVOICE

57504

There is no evidence of mechanical small intestinal ileus. A gastrointestinal maldigestion pattern is noted and suggests presence of functional ileus which may be associated with gastritis, gastroenteritis, dietary indiscretion, or other. Correlation with the available ultrasonographic findings recommended.

DATE

3-27-23

Presence of mineral opaque material was not noted radiographically in the position of the

PATIENT

gallbladder.
