

**PATIENT**

Captain Morgan Hack

**PRESENTING CLINICAL SIGNS**

Limping on /off front right foot past two weeks. Pt is typically very active and able to go on strenuous hikes. O's see the limp when getting up after a period of rest. Pt is maintained on monthly flea/tick preventive and 4dx is negative

**SPECIES**

Canine

Abnormal PE/Chem/CBC/UA Results: Pt was resented right forelimb flexion of elbow. Concern for elbow dysplasia vs slight tendonitis vs OA

**BREED**

Husky Mix

**RADIOGRAPHIC STUDY OF THE ELBOWS**

Mediolateral views of the elbows and carpi and craniocaudal views of the elbows with carpi totaling 5 images available for review.

Elbow read requested.

**SEX**

MN

**RADIOGRAPHIC FINDINGS**

The right and left elbow present within normal limits. The medial coronoid processes are well delineated and uniform in opacity. The articular margins are intact and smooth. No evidence of subchondral bone defects are seen. The joint spaces are congruent. There is no evidence of traumatic injury, aggressive bone lesions, or degenerative joint disease.

**AGE**

5

**RADIOGRAPHIC DIAGNOSIS**

- Radiographically normal elbows.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic findings of the elbows are considered within normal limits. There is no evidence of elbow dysplasia and no other structural osseous or articular pathology noted radiographically. Consider soft tissue trauma or inflammation as well as lameness of other origin a potential.
