

PATIENT PRESENTING CLINICAL SIGNS

Bree Fox Limping on right hind leg occasionally. Unable to weight bear properly for last 18 days, after jumping.

SPECIES RADIOGRAPHIC STUDY OF THE STIFLES

Canine 2 mediolateral images of the stifles both of which labeled left stifle, 2 ventrodorsal hip extended views of the pelvis, and 1 whole body thoracic radiograph totaling 6 images available for review.

BREED Interpretation of the stifles requested.

Chihuahua RADIOGRAPHIC FINDINGS

Reduced muscle volume of the right hind limb is noted.

SEX Both patellae present medial luxation.

Female Spayed Medial curvature of the proximal tibia is seen in both hind limbs.

AGE Both stifles present osteoarthritic changes which are moderate on the right and mild on the left side.

10 Years Focal block vertebra malformation in the tail is seen.

INTERPRETED BY RADIOGRAPHIC DIAGNOSIS

Nele Eley, DVM
Dr. med. Vet. DipECVDI

- Bilateral medial patella luxation with moderate right sided and mild left side stifle osteoarthritis.
- Disuse atrophy of the right hind limb musculature.
- Suspect mild angular limb deformity with medial curvature of both tibia.

HOSPITAL NAME

Truscott Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals bilateral medial patella luxation.

REFERRING VET

Mena Abdelsayed

The osteoarthritic changes associated with the stifle arthropathy are moderate on the right and mild on the left side. Concurrent cruciate ligament and meniscal injury cannot be ruled out. Correlate with the clinical palpation.

The medial curvature of the proximal tibiae may predispose to medial patella luxation.
