SEX RADIOGRAPHIC STUDY OF THE ABDOMEN

Neutered Male Right lateral and ventrodorsal views of the abdomen totaling two images available for review.

RADIOGRAPHIC FINDINGS

AGE The patient's body condition score appears to be excessive.

4 Years The abdominal serosal detail is maintained.

The kidneys, liver, and urinary bladder present within normal limits.

INTERPRETED BY

There is a mild amount of food and gas seen within the stomach.

**Nele Eley (Ondreka),
DVM Dr. med. vet.,
DipECVDI**

The small intestinal loops are non-dilated and evenly distributed throughout the mid abdomen. A mild amount of gas is seen within the small intestine.

HOSPITAL NAME

All segments of the colon contain highly inspissated mineral dense fecal matter.

DPC Vet Hospital

The descending colon and rectum are mildly dilated with large amount of inspissated fecal matter.

The lumbar spine, lumbosacral junction, and pelvis present within normal age related limits.

REFERRING VET

A mild step formation may be present between the femoral head and femoral neck in both hindlimbs.

Dr. White Mild smooth new bone formation is noted at the acetabular margin of both coxofemoral joints.

RADIOGRAPHIC DIAGNOSIS
INVOICE

46855

- Constipation and mild dilation of the colon with highly inspissated fecal matter
- Bilateral questionable malalignment of the femoral head and femoral neck
- Mild bilateral coxofemoral joint osteoarthritis
- Obesity

DATE

4/20/23

PATIENT

Pewter Yon

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals a new constipation and dilation of the colon with highly inspissated fecal matter. Dehydration, dietary causes, behavioral causes, and less likely inflammation, infection or systemic disease are potential underlying causes.

SPECIES

Feline

There is mild bilateral coxofemoral joint osteoarthritis, which may be due to feline hip dysplasia or prior trauma including slipped capital femoral epiphysis. However, it remains questionable whether the relatively mild radiographic changes of the coxofemoral joints are able to fully explain the development of recurrent constipation, even with reduced mobility.
