

PATIENT PRESENTING CLINICAL SIGNS

Piper Quilter post op PDA ligation. 10 days post op
Abnormal PE/Chem/CBC/UA Results: This study is a follow up of previous radiographs of PDA.

SPECIES RADIOGRAPHIC STUDY OF THE THORAX

Canine Right/left lateral and ventrodorsal views of the thorax totaling 6 images provided for review in JPEG format.

BREED RADIOGRAPHIC FINDINGS

Dalmatian A duct occluder is seen level with the ductus aneurysm.

The vertebral heart score appears to be stable and ranges between 13.5 and 14.0 on the available images.

SEX

Female The hyperperfusion and volume overload of the pulmonary vasculature is decreased. The pulmonary vasculature is thin.

AGE

The ductus lump and mild aorta bump are still seen.

12 Weeks The size of the left atrium appears left prominent compared to the prior views. The cranial mediastinum is widened by a thymic remnant silhouetting with the cranial contour of the cardiac silhouette. No evidence of pulmonary edema is seen.

INTERPRETED BY Thickening of the left lateral thoracic wall level with the 3rd to 5th rib is present.

Nele Eley (Ondreka),

DipECVDI

RADIOGRAPHIC DIAGNOSIS

- PDA attenuation with decreased volume overload of the pulmonary circulation

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME

Pinebrook AH

The radiographic study suggests reduced volume overload of the lung, as indicated per the reduced diameter of the pulmonary vasculature compared to the prior study. The vertebral heart score is stable, if not mildly reduced. The left atrium is radiographically less prominent. The findings are within the expected limits after PDA occlusion.
