BREED

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Maltese

Right/left lateral and ventrodorsal views of the thorax and abdomen totaling 5 images available for review.

SEX

RADIOGRAPHIC FINDINGS

FS

Patient has a history of femoral head ostectomy.

Abdomen

AGE

The patient is in thin body condition.

14 Years

Reduced serosal detail is noted within the abdomen and appears to be accentuated within the mid ventral abdomen.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Mild dorsal deviation of the descending colon is noted.

Thorax

HOSPITAL NAME

Animal Paradise
Hospital

Both elbows present osteoarthritic changes.

There appears to be mild generalized osteopenia which is presumed to be age related.

The radiographic presentation of the cardiac silhouette is within age related normal limits.

Mild flattening of the caudal cervical trachea is seen.

REFERRING VET

Dr. Elshafie

There is cervical and cranial thoracic esophageal aerophagia.

The lung and bronchial tree are considered within age related normal limits.

INVOICE

No evidence of mediastinal widening is noted.

RADIOGRAPHIC DIAGNOSIS

DATE

4-21-22

- Suspect mid abdominal mass effect and reduced serosal detail.
- Mild tracheal collapse.
- Aerophagia.
- Bilateral elbow osteoarthritis.
- Osteopenia

PATIENT

Sophie Mack

- Bilateral femoral head ostectomy
- Stifle osteoarthritis.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

SPECIES

Canine

The reduced serosal detail may be due to lack of abdominal fat however, a small amount of peritoneal effusion or mesenteropathy cannot be ruled out. The findings furthermore suggest potential for a mid-mesenteric mass effect with mild dorsal deviation of the descending colon. Abdominal ultrasound is recommended for further definition.
