

**PATIENT PRESENTING CLINICAL SIGNS**

Riley Cheung Right ACL/MPL 1 year ago Weight bearing RHL but will skip steps when pace is increased. Right stifle palpates stable. Mild iliopsoas pain

**SPECIES RADIOGRAPHIC STUDY OF THE PELVIS & RIGHT STIFLE**

Canine Mediolateral views of the right stifle and lateral and ventrodorsal views of the pelvis totaling 3 images available for review.

**BREED RADIOGRAPHIC FINDINGS**

Poodle Mix Patient has a history of right cranial cruciate ligament repair and medial patella luxation.

**SEX** The coxofemoral joints present within normal limits. The femoral heads are rounded and deeply situated within the acetabular grooves. Femoral head coverage is adequate. Joint spaces are narrow and even.

FS The patellae are in situ.

**AGE** The muscle volume of both hind limbs appears to be adequate and symmetric.

2 Years Mild sclerosis of the drill hole margins in the tibial tuberosity is seen. There is moderate articular swelling of the right stifle joint. Mild periarticular osteophytes are noted.

**INTERPRETED BY** No evidence of cranial thrust of the tibia is present.

Dr. med. Vet. DipECVDI

**RADIOGRAPHIC DIAGNOSIS**

- Normal coxofemoral joints
- History of extracapsular repair of the right cruciate ligament with articular swelling and mild osteoarthritis.

**HOSPITAL NAME**

Animal Surgical Center

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study reveals mild osteoarthritis of the right stifle joint which may well be within normal limits after cruciate ligament injury and extracapsular repair. The patellae are in situ at the time of the examination.

**REFERRING VET**

Animal Surgical There is no evidence of disuse atrophy in the right hind limb.

**INVOICE** The coxofemoral joints present within normal limits.

57984 The gait abnormality may be a consequence of the prior patella instability. However, other causes including nerve root sign and other neurologic disease cannot be ruled out.
