

**PATIENT PRESENTING CLINICAL SIGNS**

Phenom Muchinski Further evaluation of the rectum and anal glands due to recently noted blood in stool.

**COMPUTED TOMOGRAPHIC STUDY OF THE PELVIS****SPECIES**

Plain and post contrast studies of the pelvis available for review.

Canine

**COMPUTED TOMOGRAPHIC FINDINGS**

The right anal sac presents within normal limits.

**BREED**

Bernese Mountain  
Dog

Increased contrast enhancement and soft tissue swelling appears to be present in the dorsal and medial aspect of the left anal sac. A discrete mass, however, cannot be identified.

The sacral and hypogastric lymph nodes present within normal limits.

**SEX**

The left and right medial iliac lymph nodes present within normal limits.

Neutered Male

A moderate amount of fecal matter with multiple mineral attenuating foci is seen within the descending colon and rectum. No obvious wall changes of the colon and rectum are identified.

**AGE**

The urinary bladder presents within normal limits.

5 Years

**COMPUTED TOMOGRAPHIC DIAGNOSIS****INTERPRETED BY**

Nele Eley (Ondreka),  
DVM Dr. med. vet.,  
DipECVDI

- Focal soft tissue thickening within the dorsal and medial aspect of the left anal sac.
- No evidence of a rectal or perirectal soft tissue mass.
- Normal sublumbar lymph nodes.

**INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS**

Focal soft tissue thickening is noted within the dorsal and medial aspect of the left anal sac. A discrete mass, however, is not identified. Correlate with the clinical palpation. The source of the hematochezia remains unclear, however, colitis and soft tissue injury cannot be ruled out entirely.
