RADIOGRAPHIC FINDINGS

Patient has a history of high left thoracic limb amputation.

AGE

8 Years, 6 Months

Metal clips are seen in the prior surgical site in the craniolateral thoracic wall.

The radiographic presentation of the pulmonary parenchyma is within age related normal limits. Mild generalized bronchial wall enhancement is seen and considered within age related normal limits. Occasional pulmonary osteomas are noted. No evidence of interstitial pulmonary nodules or masses is seen.

There is no evidence of mediastinal lymphadenomegaly or other abnormal mediastinal widening.

The radiographic presentation of the cardiac silhouette is within normal limits.

Mild inward rotation of the last two sternebrae is seen and likely stationary, chronic, and incidental.
