ULTRASONOGRAPHIC STUDY OF THE LEFT STIFLE

4 Dicom loops of the infrapatellar view available for review.

BREED

Husky

ULTRASONOGRAPHIC FINDINGS

There is no evidence of increased effusion in the infrapatellar recess of the left stifle joint. Mild apical remodeling of the patella is seen. The infrapatellar fat pad presents no significant structural changes.

SEX

M

The cranial cruciate ligament is continuous with only mild internal heterogeneity.

Mild osseous irregularity of the intercondylar eminence of the tibia is seen which, however, may be within the limits of normal anatomic variation.

ULTRASONOGRAPHIC DIAGNOSIS

- Suspect cranial cruciate ligament edema in the left stifle.

AGE

7

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The ultrasonographic findings do suggest presence of cranial cruciate ligament edema. No evidence of fiber disruption in terms of complete or partial rupture of the cranial cruciate ligament can be identified at this point.
