

PATIENT

Louise Gerth

PRESENTING CLINICAL SIGNS

Lethargy/Coughing: r/o secondary to heart disease, lung pathology, systemic disease, URI, open

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE THORAX

Right/left lateral and ventrodorsal views totaling 3 images available for review.

BREED

Domestic Shorthair

RADIOGRAPHIC FINDINGS

The patient is mildly obese.

Mild T13/L1 Spondylosis deformans is seen.

The lungs are deeply inflated. The ribcage is mildly expanded.

SEX

Spayed Female

A moderate generalized bronchial lung pattern is noted and evenly distributed throughout the lung. Mild peribronchial cuffing is noted.

Course and width of the trachea are considered within normal limits.

AGE

9 Years

There is no evidence of mediastinal widening or tracheobronchial lymphadenomegaly.

RADIOGRAPHIC DIAGNOSIS

- Moderate generalized active lower airway pattern.
- No radiographic evidence of cardiovascular pathology.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings are suggestive for chronic active lower airway disease. Allergic lower airway syndrome is considered most likely based on the patient demographics; however, infectious bronchitis such as viral, bacterial, parasitic, or protozoal cannot be ruled out entirely. Consider a clinical trial of treatment for feline asthma versus further definition by means of airway sampling.
