

**PATIENT**

Whiskey Scrogam

**PRESENTING CLINICAL SIGNS**

Hx for rad report: Intermittent left forelimb lameness for one month. No pain elicited on exam. Slight click/crepitus with manipulation of left elbow.

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE LEFT ELBOW**

Mediolateral and craniocaudal views of the left elbow totaling 2 images available for review.

**BREED**

Terrier Mix

**RADIOGRAPHIC FINDINGS**

The outline of the medial coronoid process is mildly reduced. There is mild trochlear notch sclerosis of the ulna. No evidence of periarticular osteophytes is noted. The elbow joint spaces are congruent. There is no evidence of subchondral bone defects.

**SEX**

FS

Note the presence of mild soft tissue swelling around the 2<sup>nd</sup> digit in the left front paw with reduced opacity of the distal phalanx.

**AGE**

6 Years

**RADIOGRAPHIC DIAGNOSIS**

- Suspect medial coronoid pathology of the left elbow with no signs of secondary osteoarthritis.
- Discrepant radiographic findings in P3 of the 2<sup>nd</sup> digit - left front paw (not part of the imaging request)

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic findings of the left elbow suggest potential for medial coronoid pathology. However, significance of which is variable and questionable in small breeds and in general, and in this patient are no signs of secondary osteoarthritic changes of the elbows, so I doubt the clinical significance of the radiographic findings.

**HOSPITAL NAME**

Paws and Claws Pet  
Care

Please note the presence of radiographic changes in the distal phalanx of the 2<sup>nd</sup> digit in the left front limb which require further verification.
