

**PATIENT**

Ellie Bray

PRESENTING CLINICAL SIGNS

Ellie fractured her left rear leg and has been in a splint for 2 weeks.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE LEFT TIBIA & FIBULA

Mediolateral and craniocaudal views totaling 2 images available for review.

BREED

Golden Retriever

Patient has a history of traumatic osseous injury 2 weeks prior.

SEX

Female

Mild residual soft tissue swelling is seen circumferential to the fractured area.

The tibia presents a long spiraling diaphyseal fracture in its mid and proximal diaphyseal third. Mild sclerosis of the fracture margins is seen as well as a moderate amount of mineralized callus. The fracture margins are unsharp but can still be recognized readily. The bridging callus is incomplete. The alignment of the bones is in situ. No evidence of angular deformity or displacement is seen.

AGE

10 Weeks

RADIOGRAPHIC DIAGNOSIS

- Subacute complete traumatic spiraling fracture of the left tibial diaphyseal in reparation phase.

INTERPRETED BYNele Eley, DVM
Dr. med. Vet. DipECVDI**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic findings are considered within normal limits for the reparation phase of secondary bone healing. Partial biomechanical stability may have been reestablished, however, restriction of exercise should be restricted for at least two weeks more.
