

PATIENT

Asia Miller

PRESENTING CLINICAL SIGNS

Presented for mammary mass surgery consult. Uploading 3 chest rads to check for mets.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Right/left lateral and ventrodorsal views of the thorax totaling 3 images available for review.

BREED

Shih Tzu

RADIOGRAPHIC FINDINGS

Patient has a history of mammary mass consistent with the enlargement of one abdominal mammary complex and mamil.

SEX

Female

Mild T5/6 spondylosis deformans is noted.

The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE

11 Years

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

There is no evidence of interstitial pulmonary nodules or masses. A mild generalized bronchointerstitial lung pattern is noted with even distribution throughout the lung and considered within age related normal limits.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

HOSPITAL NAME

DPC Veterinary
Hospital

RADIOGRAPHIC DIAGNOSIS

- Normal age related lung and bronchial tree.
- No evidence of pulmonary metastatic disease.
- Mild T5/6 spondylosis deformans.
- Mammary tumor- abdominal mammary complex based on history.

REFERRING VET

Dr. Loduca

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is negative for presence of pulmonary metastatic disease or mediastinal lymphadenomegaly. The findings of the thorax are considered within age related normal limits.
