PRESENTING CLINICAL SIGNS

Non weight bearing lameness RH x 3 d. Today toe touching but will not allow o to touch.
Abnormal PE/Chem/CBC/UA Results: Pain on palpation of RH 2nd digit. Would not allow
palapation without sedation. All nails intact and not broken/cracked, and no bruising on digit 2 or
intradigitally.

RADIOGRAPHIC STUDY OF THE RIGHT HIND PAW

Mediolateral and dorsoplantar views of the right hind paw totaling 2 images available for review.

RADIOGRAPHIC FINDINGS

Atavism of the 1st digit is noted in both hind limbs and considered incidental.

No significant soft tissue swelling can be identified.

The proximal, middle, and distal phalangeal bones of the 2nd digit present within normal
radiographic limits. There is no evidence of traumatic osseous injury or aggressive bone lesions.

The sesamoid bones of the metatarsophalangeal joint are in situ.

RADIOGRAPHIC DIAGNOSIS

- Normal radiographic findings of the right hind paw.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the right hind paw does not reveal evidence of soft tissue or osseous
changes. The source of the pain and lameness remains unclear. However, especially soft tissue
trauma and inflammation/infection cannot be ruled out based on the radiographs alone.

PATIENT

Mojo Booth

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
