RADIOGRAPHIC STUDY OF THE THORAX

Right/left lateral and ventrodorsal views of the thorax totaling 3 images available for review.

SEX

SF

RADIOGRAPHIC FINDINGS

Mild spondylosis deformans is seen between T4 and T5.

AGE

7 Years, 7 Months

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits. The vertebral heart score is 9.3.

INTERPRETED BY

Nele Eley, DVM
 Dr. med. Vet. DipECVDI

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

Redundancy of the dorsal tracheal ligament of the cervical trachea is noted. No true tracheal collapse is seen.

HOSPITAL NAME

DPC Veterinary Hospital

The lung and bronchial tree present within age related normal limits. No evidence of pulmonary nodules or masses is seen.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

REFERRING VET

Dr. Feldt

The stomach is post-prandial.

RADIOGRAPHIC DIAGNOSIS

- Normal age related thorax.

INVOICE

52278

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings of the thorax are within age related normal limits. No radiographic evidence of cardiovascular pathology or bronchopulmonary disease is seen.

DATE

6-1-22

The redundancy of the dorsal tracheal ligament is a common incidental finding. It can be associated with dynamic tracheal disease. Clinical correlation is required.
