

PATIENT

Ada Cowal

PRESENTING CLINICAL SIGNS

Vomiting and bloody diarrhea since this morning
Abnormal PE/Chem/CBC/UA Results: Mild hypokalemia, some elevation in ALP, and P

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views of the abdomen totaling 3 images available for review.

BREED

Papillon

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

SEX

Female

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

5 Months

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The gastrointestinal tract is largely empty. A mild amount of gas and granulated material compatible with food is seen within the stomach. There is no evidence of abnormal dilation, radiopaque foreign material, or malpositioning of the stomach.

HOSPITAL NAME

St. Catherine's Animal
Hospital

The small intestinal loops are evenly distributed throughout the mid abdomen with no evidence of abnormal dilation, plication, or radiopaque foreign material.

The colon contains a moderate amount of gas and is seen in its anticipated position.

REFERRING VET

Dr. Mena

RADIOGRAPHIC DIAGNOSIS

- Normal radiographic appearance of the abdomen with largely empty small and large intestine - no evidence of mechanical ileus.

INVOICE

52359

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the abdomen is negative for mechanical ileus. Functional ileus is thought likely based on the radiographic findings and further definition by means of abdominal ultrasound could be considered in case of deteriorating or persisting / recurring clinical signs.
