PRESENTING CLINICAL SIGNS

Geddy jumped off the couch earlier today then start limping on left hind leg, went to the back yard and jumped off the back deck as well. Can bear some weight in exam room.

Abnormal PE/Chem/CBC/UA Results: Cranial drawer signs positive in the left hind leg and, negative in the right. Blood work indicate dehydration, mild increase in TBIL 31 (0-9), very mild increase in Ca and GGT, otherwise unremarkable

RADIOGRAPHIC STUDY OF THE STIFLES & PELVIS

Labeling with a side marker is not available in the lateral and craniocaudal views of the stifles and pelvis.

RADIOGRAPHIC FINDINGS

Both coxofemoral joints present within normal limits. There is no evidence of dysplasia or osteoarthritis.

The muscle volume of both hind limbs appears adequate and symmetric.

No significant osteoarthritic changes of the stifles are seen. The patellae are in situ.

There appears to be mild cranial thrust of the tibia in one of the stifle joints. However, laterality cannot be specified.

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal coxofemoral joints.
- Radiographic potential for cranial cruciate ligament injury in one of the stifle joints.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings suggest potential for failure of the cranial cruciate ligament function in one of the stifle joints. Laterality unfortunately cannot be specified as a side marked is not assigned to the pertinent image. Clinical correlation is therefore required. No clear radiographic signs of osteoarthritis are seen in either of the stifle joints.

PATIENT

Geddy Marks

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

SPECIES

Canine

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
