

**PATIENT**

Hershey Wright

**PRESENTING CLINICAL SIGNS**

chronic intermittent L forelimb lameness, now NWB  
Abnormal PE/Chem/CBC/UA Results: Shoulder pain on extension and adduction

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE SHOULDERS**

Mediolateral and craniocaudal views of both shoulders totaling 4 images available for review.

**BREED**

Schnauzer, Miniature

**RADIOGRAPHIC FINDINGS**

The radiographic presentation of the left shoulder is within normal limits.

The muscle volume of the left front limb appears to be reduced.

**SEX**

Note the radiographic presence of left elbow arthropathy.

MN

The right shoulder presents within normal limits.

**AGE**

10 Years

No evidence of osteoarthritis or osteochondritis is seen. There is no evidence of aggressive bone lesions.

**RADIOGRAPHIC DIAGNOSIS**

- Normal radiographic presentation of both shoulders.
- Muscle atrophy of the left front limb musculature.
- Note the presence of left elbow arthropathy.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**HOSPITAL NAME**

Pinebrook Animal  
Hospital

The radiographic study of the shoulders reveals no evidence of arthropathy or other osseous lesion. Soft tissue pathology such as within the biceps rotator cuff, medial joint compartment, or brachial plexus, as well as within the cervical spine cannot be ruled out.

Note the presence of left elbow arthropathy and correlate with the clinical signs.
